Expressing Disagreement

What disagreement can teach us about semantics, and what semantics can teach us about disagreement

preliminary draft for the conference “Faces of Disagreement” Montreal, 26-28 May 2016

Abstract. This paper is an occasion to take stock of the place that the argument from (faultless) disagreement has occupied in philosophy of language in the last 15 years, in particular within the debate between contextualism and relativism. The survey offered in the first part of the paper appears to show that the phenomenon of disagreement fails to provide any strong motivation for adopting any novel semantic framework, contrary to relativists' claims. But, on a more positive note, the interest in disagreement has allowed us to better understand how language works. The second part of the paper explains how the fine-grained structure of meaning – at the level of words, sentences and even entire discourse – reveals a variety of sources that may lead discourse participants to disagree. It is also argued that due to certain linguistic features of predicates of personal taste, disagreement over matters of taste is, at least from a language-oriented perspective, interestingly different from disagreement over aesthetic and moral matters.

Keywords: faultless disagreement; contextualism; relativism; predicates of personal taste; presupposition; discourse structure.

* The title “Expressing Disagreement” has been already used in Dan López de Sa (2015), though with a different subtitle. Since I had already given this title for the conference program, I'll keep it for now.
1 The argument from disagreement: how it started, how it ended

I would like to start the paper with a concise and hopefully not too biased survey of the argument from faultless disagreement, and its role in the contextualism-relativism debate. The survey has a double purpose. One is to provide information for those who are not familiar with the debate, and in particular, for those who are approaching the topic of disagreement from disciplines such as epistemology or metaethics. Another is to take stock of what has happened in the past 10 to 15 years, and, in doing so, clarify my own contribution to the debate.

Faultless disagreement has been one of the most vividly debated topics in the recent years – and for a good reason, since it does involve something of a puzzle. In what follows, I will present the puzzle in neutral terms, and will then sketch, in very rough lines, the argument that the relativists (well, some of them) have built upon the puzzle for their view and against the rival invariantist and contextualist views. I will then go through some of the main responses that the argument has elicited in the literature, which, taken together, lead to the conclusion that the choice between contextualist and relativist (or, for that matter, invariantist) semantics is pretty much orthogonal to the account of disagreement.

The puzzle is presented typically in form of a dialogue, either using a predicate of personal taste, of which 'tasty', 'delicious' and 'fun' have been seen as paradigms, or using expressions that reflects one's information state, of which modal auxiliaries 'might' and 'must' have been seen as paradigms. The dialogues are meant to reflect the sort of natural and spontaneous dialogue that people might have, say, in discussing food (in the case 'tasty' or 'delicious'), activities (in the case of 'fun'), eventualities (in the case of epistemic modals), and so on.1 Here is an example:2

1. Kathy: “This is delicious.”
   Rob: “No, it isn't.”

1 For the sake of convenience, I will be mainly talking about predicates of personal taste, and will leave aside epistemic modals. I hope that nothing crucial hinges on that.
2 While the examples in the literature are typically made up, I tried searching for a real life example. I have performed google searches with “tasty. No, it isn't” and “delicious. No, it isn't”. The downside of google search is that it is not limited to dialogues, but the advantage is that the amount of data it covers is amazingly large. Somewhat surprisingly, the search with 'tasty' didn't yield any disagreement dialogue of the form “Vegemite is tasty. No, it isn't” - other than those used in philosophy papers. The same can be said about 'delicious', with one exception that I explain in the next footnote. There are nevertheless results from non-philosophical sources, and here are a few: “I wonder what he puts in his vodka. Delicious. No, it isn't wormwood.” “It's honestly so delicious, no it isn't the same as cows milk but it's a creamy, sweet drink that can take the place of milk in almost all recipes.” “Wicks' pizza is delicious. No, it isn't artisan or coal fired or covered in organic toppings. But, it is craveable.” “It's DELICIOUS! No it isn't a salad”. The examples all share the same form, in which the negation particle 'no' does not target any explicitly stated content.
3 The closest I got to a disagreement case from corpus search is this the following rent about parsley, entitled “Fuck parsley”: “Seriously. Who could legitimately put parsley in their mouth have it chomped up and rubbed all over their taste buds and say "Wow this is delicious". No it isn't and you must be lying. Oh look at this green bitter, dry, rough piece of shit on my plate that they have just put there to give the plate...”  

Isidora Stojanovic, “Expressing Disagreement”
The dialogue is taking place in a restaurant, and 'this' refers to finely chopped fresh parsley. Suppose that Kathy loves parsley, and Rob hates it. Firstly, if the parsley at stake tastes delicious to Kathy, and it tastes awful to Rob, it seems that they are both right, and that they are both saying something correct, or even true. At any rate, neither of them seems to be wrong in the way one would be in making a false claim, such as “Montreal is to the West of Toronto”. Secondly, it also seems that they are in disagreement, which is indicated by Rob's use of the negation particle 'no', as well as his asserting the negation of the sentence asserted by Kathy. Thirdly, if disagreement is to be genuine, it seems that this should preclude the possibility that both parties be right. While each of the three intuitions sounds plausible when considered on its own, taken together, they are in tension (or even in contradiction).

I suggest that the term “faultless disagreement” be used to describe the real phenomenon that arises when we have dialogues that trigger those three intuitions. Granted that there is solid empirical evidence that there is such a phenomenon (and I don't think that anyone in the debate disputes this), the theoretical question that arises is how one should account for those seemingly inconsistent intuitions. The early relativist literature (e.g. Kölbel (2002), Richard (2004, 2008), Egan et al. (2005), Lasersohn (2005)) yields the following picture of the repartition between the possible theoretical positions. Invariantism would be the view which seeks to explain away the first intuition: it may seem that both parties are right, but they really aren't. Contextualism would be the view that seeks to explain away the second intuition: it may seem that there is disagreement, but there really isn't. Finally, relativism would be the view that does away with the third intuition, and seeks to demonstrate that there can be genuine disagreement even when both parties are right.

We'll shortly see that this picture is not quite accurate, and in particular, that contextualism encompasses several views that accept that there can be disagreement and are perfectly able to account for it. In the remainder of this section, I will first look at the way in which certain relativists have attempted to account for faultless disagreement, and explain why their attempt has failed, and then I will go through various (arguably successful) contextualist attempts to account for disagreement.

some color. If you want to put color on my plate just print a copy of a picasso on A4 paper and place it on top of my meal, because I would rather eat that than that useless green poor excuse for an edible substance. Just to be clear, I am not at all a fussy eater. I eat absolutely everything from all corners of the globe and I've even eaten animals I didn't even know existed in China. So it's not that. It's just, fuck you parsley.” In the dialogue in (1), Rob stands Rob Millsy, the author of the rent, and Kathy is Kathy Gunst, a chef who likes parsley. Here are the relevant internet sources:

Isidora Stojanovic, “Expressing Disagreement”
1.1. The argument from disagreement as an argument for relativism

The argument from faultless disagreement to semantic relativism may be seen as taking the form of an inference to the best explanation. Caricaturing perhaps a bit, a relativist would argue along the following lines.4 Step one. The three intuitions that we are confronted with (faultlessness, disagreement, and disagreement-precludes-faultlessness) are not on a par. The first two are more robust and both of them ought to be upheld. (This is why they think that neither invariantism nor contextualism are viable positions.) Hence we must give up the third intuition, and make room for a notion of disagreement that does not preclude that both parties may be right. Step two. The best way to make room for such a notion is by allowing for contents whose truth depends on an agent (or assessor, or judge). What it takes for two parties to disagree is that one party asserts some content, and the other party rejects that same content. This is compatible with the idea that both parties are right – provided, of course, that the content over which they disagree is true when assessed from (or evaluated at) the one party, and false when assessed from/evaluated at the other. The relativist semantic framework, in which contents are defined as mappings from agents (assessors, judges) and other parameters, such as worlds and times, to truth values, would then yield a straightforward account of faultless disagreement.

I will focus here on only one line of criticism, which is the one that I advanced in Stojanovic (2007).5 It goes as follows. Assume, for the sake of the argument, that we are operating with a relativist semantics, on which contents are mappings from agents6 (and other parameters) to truth values. Assume furthermore that speakers are semantically competent, in the sense that they are aware that a statement of the form “This is delicious” is apt to bear a truth value only when it is evaluated at an agent (or whatever other suitable parameter). Then, looking at the example in (1), Kathy knows that the content that she is asserting is true or false depending not only on what the world is like, but also on the judge. The same goes for Rob when he denies the content asserted by Kathy. Now, if Kathy intends the content that she is asserting to be evaluated for truth at herself, and if Rob intends the denial of that content to be evaluated for truth at himself, then it is no longer clear why they should be seen as disagreeing. For both of them know that one and the same content may take different truth values when evaluated at different agents, and they also know that the one’s assertion and the other’s denial of the same content are inconsistent only when evaluated with respect to the same agent. Hence if each party intends the asserted content to be evaluated at himself or herself, and if this is mutually clear between them, then they must realize that there is no clash in truth value between their

4 I think that it is fair to attribute this line of argument to Kölbel (2002), Richard (2004, 2008), Lasersohn (2005), and Egan et al. (2005). Shortly we will see that the view in MacFarlane (2014) is more elaborate.
5 I believe that the same line of criticism has been offered elsewhere (add references), which comes as no surprise, as it is very immediate.
6 What is exactly the nature of the parameter at stake – agents? groups of agents? standards? tastes? dispositions? – is admittedly an important question, though one that we can presently leave aside.

Isidora Stojanovic, “Expressing Disagreement” 4
respective claims (when evaluated for truth as they each intend them to be), and that their apparent disagreement must be driven by something else than aiming at truth.

The rebuttal of the relativist’s argument that I have just sketched is formulated for a simple version of the relativist framework, namely, the one that defines contents as mappings from parameters that include agents (judges, assessors) to truth values, and that does not stipulate that there is a determinate way in which the context of utterance would fix the values at which the truth of the content is to be evaluated. This is the framework of Kölbl (2002) and Lasersohn (2005), but not that of MacFarlane (2014), who, in the formal framework, introduces a distinction between contexts of utterance and contexts of assessment. While there are genuine formal differences between the simpler framework and MacFarlane’s, that does not make the latter better suited to account for the puzzle. For assume Kathy and Rob to be competent speakers; they must be aware, then, that their claims can only be evaluated for truth with respect to a context of assessment. If Kathy intends her claim to be evaluated with respect to her own context of assessment, and Rob intends his denial of Kathy’s claim to be evaluated with respect to his own context, and if this is mutually clear between them, then we have hardly made any progress towards an explanation of their presumed disagreement. MacFarlane is aware, though, that the formal framework does not by itself provide any account of disagreement. He does offer such an account, though, by positing two norms of assertion, a \textit{truth} norm (2014: 102-103), and a \textit{retraction} norm (2014: 108). Regardless of the problems and/or merits of MacFarlane’s proposal, what matters for our present purposes is that, although the two norms are formulated by presupposing a distinction between contexts of utterance and contexts of assessment, the gist of his explanation is not at all bound up with relativism \textit{qua} semantic framework.\footnote{This is admittedly a bit quick, but I will not go into further elaboration in the present draft partly because I don't have the time, and partly because MacFarlane's normative story is likely to be on the wrong track. In particular, it has been shown in Kneer (2015) that almost no ordinary speaker subscribes to the norm of retraction either in case of claims about taste or in the epistemic case. Kneer tested both for retraction and for reassessment of truth value regarding claims such as “Fishsticks are tasty” that a person made at an earlier time (when they used to find them tasty) and was asked to reassess from a later time (when they no longer found them tasty). Ordinary speakers do not think that the change of taste makes the earlier claim false, nor do they think that a person is required to retract their claim. I am also skeptical that MacFarlane's formal account presents any advantage over the simpler account; see Stojanovic (2012b) for details.}

1.2. The argument from disagreement as an argument against contextualism (and invariantism)

The argument from disagreement has triggered a large number of responses. In what follows, I will focus on five, which I take to be the most important. All five have been made (unless I am mistaken) on behalf of contextualism, though some responses work equally well on behalf of invariantist approaches.\footnote{Invariantist semantics, which would be a semantics that analyses a predicate such as ‘tasty’ or ‘fun’ as a} Let me stress from the outset that
these approaches should not be seen as competing with each other but, rather, as complementing each other and possibly overlapping. I label them as follows, and will discuss them in this order: (i) the underdetermination approach; (ii) the metasemantic approach; (iii) the metalinguistic approach; (iv) the presuppositional approach; (v) the attitudinal approach.

The underdetermination approach. I start with this one not only because it is the one that I proposed in Stojanovic (2007) but also because it was one among the first to be put forward. It goes as follows. The intuitions of faultlessness and of disagreement that dialogues such as (1) trigger are not to be taken at face value. At a first glance, such a dialogue may well trigger those two intuitions, but in order to know whether we have a case of genuine disagreement (i.e. disagreement over the truth of a statement), or rather, a case in which the two parties are expressing their own preferences, we need more information about the context, and in particular, on how such a dialogue may evolve. I speculated that the meaning of the claims under consideration can be made more specific, and receive different readings. For example:

2. Kathy (talking about parsley): “This is delicious”.
   Rob: “No, it isn't.”
   Kathy: “Well, look, all I mean is that to me it is delicious.”
   Rob: “OK, fair enough. But to me, it tastes like a bitter, dry and rough piece of rubbish, and I just can't understand how anyone can like it.”

3. Kathy (talking about parsley): “This is delicious”.
   Rob: “No, it isn't.”
   Kathy: “Yes it is. And I don't just mean that I like it. It is delicious, to anyone.”
   Rob: “You are completely wrong. It isn't delicious, it tastes like a bitter, dry and rough piece of rubbish.”

The way in which the dialogue in (2) evolves suggests that the intended reading for Kathy's initial claim is one on which she occupies the relevant experiencer argument, while the way in which it evolves in (3) suggests that the intended reading is a generic one, that is to say, that the experiencer argument is bound by a covert generic operator. Consequently, (2) provides a case in which the faultlessness intuition wins, so to speak, whereas (3) provides a case in which Kathy and Rob disagree, pretty much in the way in which they might disagree over the truth of some descriptive claim, such as, say, the claim that parsley contains more iron than cilantro does.

One issue that is important and that I did not address in Stojanovic (2007), but predicate that either applies to an object or doesn't, is not plausible from a linguistic point of view. Such predicates are gradable adjectives, and if they are to be such that their application conditions are context-insensitive, then they should correspond to so-called absolute gradable adjectives, such as 'open' or 'bent' (see Kennedy and McNally 2005). At the very least, predicates of taste have thresholds that may vary with the context, which already requires a contextualist semantics. In the last section, we'll see that they exhibit further context-sensitivity.

9 In Stojanovic (2007), I did not use the term “underdetermination”; I only did so in Stojanovic (2012a).
did so in Stojanovic (2012a), is the question of what kind of evidence could ultimately settle a disagreement such as the one in (3). In this respect, the underdetermination approach goes only part of the way towards accounting for the general phenomenon.

The metasemantic approach. Glanzberg (2007) provides another early response to the argument from disagreement, similar in spirit to the underdetermination approach. Glanzberg's focus, though, is on the nature of adjectives and, in particular, the fact that, qua gradable adjectives, their semantics requires scales and thresholds at which sentences containing such adjectives are to be evaluated. Relying on the significant semantic literature on adjectives, including the pioneering work on multidimensional adjectives in Bierwisch (1989), Glanzberg sets out to propose a contextualist account of predicates of personal taste, in line with the semantics of other gradable adjectives. To be sure, adjectives such as 'tasty' and 'fun' are not as simple as adjectives such as 'tall'. While 'tall' has a single conventionally associated scale, namely, height, 'fun' and 'tasty' may require multiple scales. But, as he notes, “this is not a feature specific to adjectives of personal taste. Many gradable adjectives can be associated with multiple scales. For instance, someone can be smart as in ‘book smart’ or ‘street smart’, a large city can be large in population, geography, etc.” (2007: 10). Secondly, predicates of personal taste involve response-dependent properties. It makes little sense to think of tastiness as a property that an object can possess in itself, independently of there being some individual who could potentially experience its taste (and similarly for 'fun'). Glanzberg (2007) is relatively uncommitted regarding the status of the experiencer argument. He does not posit it as a bona fide hidden argument, but writes: “To take response dependence into account, we will need to see the scales associated with tasty and fun to be experiencer-involving scales” (2007: 13). Finally, the gist of his rebuttal of the argument from disagreement is to point out that fixing all the different values of all those different parameters, in a context, is no straightforward matter and requires what he calls “indirect metasemantics.” He similarly believes that whether there is genuine disagreement or not may depend on the context: if all the relevant parameters, that is to say, scales, experiencers and thresholds, are the same for Kathy's and Rob's utterances, we do have disagreement; but if the scale that is relevant to interpreting Kathy's utterance differs from the one relevant to interpreting Rob's utterance (as will happen, for example, if the experiencers relevant to fixing her scale are, say, food connoisseurs, and the one relevant to fixing his scale are people in general), then it is no longer clear that they are disagreeing – or rather, it is no longer clear what it is that they are disagreeing about. For, in a sense, their disagreement turns on the question of how to fix the scale relevant for interpreting ‘tasty’ and, in this respect, the proposed account anticipates the gist of the metalinguistic approach, to which I now turn.

The metalinguistic approach. Sundell (2011) may be seen as the most fierce defender of the metalinguistic approach. There is some overlap between his proposal and both the underdetermination and the semantic approach, since all three hold that a dialogue that at a first glance may look like a disagreement in which the two parties disagree
about whether some object has a certain property (e.g. whether tastiness is a property of parsley) may turn out, upon scrutiny, to be a disagreement about questions such as what counts, in a given context, as “tasty”. The negotiation of scales and standards is thus seen, in the metalinguistic approach, as what often drives our disagreements not only on matters of taste, but also on aesthetic matters (see Sundell 2015) or on moral matters (see Plunkett and Sundell 2013). One of the key points of this approach is to argue that even though disagreement very often turns out to be a metalinguistic disagreement, this does not make it less important or less substantive than other kinds of disagreements. The authors also point out that in ethics and aesthetics, what the disagreements are about are often the very concepts themselves. Thus in disagreeing, say, whether discussions in analytic philosophy are aggressive, we may agree on which criteria make a discussion aggressive, and disagree whether the discussions in analytic philosophy are such, but we may also disagree about the very criteria that make a discussion count as an aggressive one. (This is my example, not theirs; but I take it that it illustrates their general point.)

The presuppositional approach. Presupposition is one of the most central phenomena in language, and we will shortly see that there is more than one way in which this notion is relevant to understanding, at least from a linguistic point of view, why one may be led to disagree with a statement made by somebody else. However, in the present context, by the presuppositional approach I mean more narrowly the approach that Dan López de Sa has been pursuing since the beginning of the debate (see López de Sa (2008), (2015)), and the one defended in Marques and García-Carpintero (2014). What the presuppositional approach shares with the first two approaches is the idea that, taken at face value, a dialogue such as (1) may turn out to be a genuine case of disagreement, but it need not be. The way the presuppositional approach accounts for this idea is that we start from the assumption that there may be different standards of taste, which hardly anyone disputes. But while we know that tastes do differ, when we use a predicate of personal taste, we normally presuppose that our interlocutors share our taste. If I take you to my favorite restaurant, and I tell you that a certain dish is delicious, that may help you decide what to order partly because we presuppose that our gustatory tastes are alike. This kind of presupposition is what López de Sa calls a presupposition of commonality. Now when we enter into a disagreement, and the presupposition is satisfied – that is to say, we do have a similar taste, then we disagree indeed, although it is no longer a faultless disagreement. For if the two interlocutors share the same standard of taste, and the standard is determinate enough, then relative to that standard, either a sentence or its negation can be true, but not both. On the other hand, if our standards of taste diverge significantly, then the presupposition fails, and a linguistic exchange of the from “This is delicious – No, it isn’t” becomes deficient in a similar way in which (adapting a famous example from David Kaplan) if I presuppose that the person at whom I am pointing is Rudolf Carnap, and you presuppose that it is Spiro Agnew, and I say “He is a famous philosopher” and you reply “No, he isn't", we are not really disagreeing.

Isidora Stojanovic, “Expressing Disagreement” 8
The attitudinal approach. The last line of response to the relativists' argument from disagreement that I want to mention takes inspiration from expressivism (see e.g. Gibbard 1992). As is well known, for an expressivist, an evaluative statement is not in the business of stating facts, rather, it aim at expressing the speaker's attitude. When Rob and Kathy disagree over the deliciousness of parsley, they are not trying to determine what parsley is factually like, but rather, Kathy is expressing her positive attitude towards parsley and Rob, his negative attitude. This clash of attitudes constitutes a genuine disagreement (or so the idea goes). If such a disagreement in attitude is already able to account for the disagreement intuition in cases such as (1), then the semantic interpretation of what Kathy and Rob are saying is, in a way, beside the point. Even if they stated their preferences in first person, as in (4) below, they would still be disagreeing in the relevant sense:

   Rob: “I dislike it.”

Although the idea derives from expressivism, an expressivist semantics is not required to deploy this kind of mechanism as an explanation of why we perceive disagreement in cases such as (1), and is a strategy available to contextualists or even invariantists. For a development of this line of reply, see, inter alia, Huvenes (2012) and Marques (2014), (2015).

With this, I close the survey of the argument from disagreement and the role that it has played in the contextualism-relativism debate. To be sure, the survey does not claim to be exhaustive, and there are other strategies that have been proposed. In the next section, I will draw some lessons regarding the relationship between theory of meaning and theory of disagreement, and will argue that these explanations of what is going on are not mutually exclusive but, to the contrary, often work together, as I will show on a concrete case.

2 No single simple and straightforward story will account for the complexity of disagreement

Based on the discussion from the first part of the paper, and in general, on a critical assessment of the place that the argument from disagreement used to occupy but gradually lost, it is tempting to draw a negative conclusion about the relationship between disagreement and semantics. On the one hand, it is, I think, widely agreed nowadays that relativist semantics per se, whether the simpler version as in Kölbl (2002) and Lasersohn (2005) or the more cumbersome version as in MacFarlane (2014), does not yield a straightforward account of disagreement. This is conceded even by the proponents of relativism, as witnessed by the need in MacFarlane (2014) to develop a heavy normative machinery to handle disagreement. On the other hand,
as revealed through the various responses to the argument from disagreement, non-relativists have a range of different mechanisms (semantic, pragmatic, cognitive) to which they can appeal in order to illuminate what is going on in various cases of disagreement over matters of taste. Several of these mechanisms are not tied to a contextualist semantics, but are available to almost equal degree to contextualists, relativists, invariantists and even expressivists.

Based on this, one may be tempted to think that semantics, that is, the theory of meaning, and the theory of disagreement, have nothing to do with each other. The intended take-home message of this paper is that we should resist such a pessimistic conclusion. The study of disagreement has, to the contrary, been a fruitful and productive enterprise that has made it possible to reach a better understanding of the fine-grained meaning structure that the expressions and constructions at stake possess. Looking at disagreement does teach us stuff about semantics – although not quite the lesson that the relativists wanted us to draw. Conversely, understanding the different aspects of meaning provides valuable insight into the reasons that may drive people into disagreeing. The remainder of the paper is an expansion on this constructive, optimistic conclusion. I will first provide something of a case study, by looking at a real life example of disagreement regarding hipsters. I will then return to predicates of personal taste, to argue that their semantics raises complexities which make the linguistic expression of disagreements over taste interestingly different from moral or aesthetic disagreement.

2.1. Disagreeing about hipsters – a case study

My case study is an online discussion about hipsters, under the title “Why do so many people hate “hipsters”?” from which I have selected several excerpts that will help me illustrate some of the previous theoretical observations regarding disagreements.10

8. I see a lot of hate for the hipster crowd and I can't really understand why. I myself am not a hipster. But I do know a LOT of people who could be considered to be hipsters and they are all really nice, well educated people. Usually very friendly people who would give you the shirt off their back if you needed it. And when it comes to music, politics, whatever.... I have never gotten the music snob vibe from them, more so awesome suggestions of some music I might not of heard.

9. I don't hate hipsters as people, I hate the hipster aesthetic because it is insincere. As I see it, hipsterdom is based on the notion that individualistic authenticity can be bought and displayed as a piece of fashion. Obviously, this is self-contradictory, and it pisses me off to no end.

10 I have probably included more excerpts that I need to make my points, but, other than the fact that they provide a more complete background for the discussion of specific examples, they are also entertaining, so I shall leave them. The post is from five years ago, the details of which may be consulted here: https://www.reddit.com/r/AskReddit/comments/fppf1/why_do_so_many_people_hate HIPSTERS/
10. The insincerity aesthetic is a little irritating, but I find the accompanying pretentiousness to be the most annoying part.

11. "Hipsters" are trend-eating, fad-mongering, consumer-whores that dress up like each other, while blindly reinforcing and building the corporatocracy they ostensibly revile. It doesn't involve any sort of creativity or intellectualism to be a hipster.

12. I don't understand why some people, myself included, are automatically "trend whores" when all we do is buy clothes we think make us look nice.

13. It is socially acceptable to hate them. Take as fact that most people crave acceptance. A way to feel a part of a group is to extol views and ideas that are already widely accepted. Given that reddit is a place where it is already popular to hate on hipsters, simply agreeing or propagating that sentiment will result in acceptance. (…) This is similar to the way that everyone seems to hate on socks and sandals. There is nothing inherently wrong with this, and in fact, it's very comfortable.

14. What bugs me is that there is this tacit assertion that it DOES take creativity and intellectualism to be a hipster. It's this completely hollow, passive-aggressive sense of superiority that bugs me. I actually sort of like the hipster look to be honest with you.

15. Because they're hypocritical. They try to be individual yet they're conforming to the same aesthetic. I don't dislike hipsters as people. I dislike hipsters as a persona. They're often pompous, arrogant, and snobbish; hating on me for my "mainstream" likes.

16. I always kinda saw your type of generalization and stereotyping as a tad bit ignorant and clueless. (as a reply to 15)

17. I always kinda sorta thought that passive aggressiveness and nonchalance were the trademarks of a hipster. (as a reply to 16)

18. I can't be a hipster because I'm fat; I can't fit in those skinny jeans and I look like an idiot in those fluorescent raybans. That's why I hate hipsters.

19. They're a commercialized and consumption-driven version of the "back to nature" movement, which is insulting to everyone who is genuinely trying to encourage a lifestyle that is basic and honest.

20. My main beef with hipsters is that they are, ostensibly, the type of people I would love to be good friends with. For the most part, they have a lot of good tastes, are more intelligent than the average human, are artsy, politically active, and individualistic. They are the people I hung out with, before they became hipsters.

21. When I think of hipsters I think of arrogant gits who are all snobby and elitist, and yet, also ignorant. If someone is that nice they're not really a hipster, by definition,
because being kind is too mainstream.

22. I dress like how most would describe a "hipster" and get insulted almost every day for it. I dress like this because I care about fashion and I believe that I look nice in these clothes. I don't do it to be different or because I think it will make me "cool", I just feel good in these clothes. I don't hate on or think I'm better than people that dress other ways, yet it's always assumed I do. I typically just have to ignore the barrage of drive-by insults I get daily because I know I'm happy how I am.

23. I think there's a difference between alternative lifestyles and being a hipster. Hipsters, to me, are all about devouring meaningful things and reducing them to their most consumerist, vapid incarnation. (…) It's a reactionary thing, experience something good in the world and then make it your own without actually adopting the principles. That's why it's something to be scorned.

The first thing that strikes one in this discussion is that it is, to a large extent, a disagreement in attitude. It is a disagreement between pro-hipsters and anti-hipsters, between people who like hipsters and those who dislike them, or even hate them. Interestingly, even though the leading question of the post is "Why so many people hate "hipsters"?", the nature of the replies and comments does not address that descriptive question (with (13) being a possible exception), but rather, it addresses something akin to a normative question along the lines of "Do "hipsters" deserve to be hated, and if so, why?"

The second striking observation is that, to a large extent, the discussion is metalinguistic. An early indication of this metalinguistic character is the use of quotation marks with the word 'hipster' in the leading question itself, and quotes are used in several posts (e.g. (11), (22)). Other clear indications of the metalinguistic character may be seen in posts whose speakers explicitly address the question of what makes a hipster a "hipster", a nice example of which is (21), repeated below as (24):

24. When I think of hipsters I think of arrogant gits who are all snobby and elitist, and yet, also ignorant. If someone is that nice they're not really a hipster, by definition, because being kind is too mainstream.

The first sentence may be interpreted as a metalinguistic statement about which group of people the term 'hipster' refers to. Note also the use of the "by definition", a clearly metalinguistic device. Other neat illustrations of the metalinguistic nature of the disagreement are (14), (17), (22), and especially (23), in which the speaker contrasts the concept of leading an "alternative lifestyle" (presumably positively valued) and "being a hipster" (negatively valued). In "Hipsters, to me, are all about devouring meaningful things and reducing them to their most consumerist, vapid incarnation", the appositive "to me" works as a metalinguistic hedge that means something along the lines "the way I understand the term 'hipster'".

I now turn to a third observation that percolates from this case study, and has to
do with something fairly similar to López de Sa’s presupposition of commonality. The kind of presupposition that lies in the background of the discussion over hipsters is certainly not the presupposition that the different participants in the debate share the same taste. To the contrary, it is taken for granted from the start that the tastes are likely to depart considerably: the anti-hipsters will likely, in general, dislike the things that are highly valued in hipster taste, while the pro-hipsters will likely include many people who themselves endorse hipster taste. (Of course, there are exceptions, an illustration of which is (14), in which the speaker expresses an anti-hipster stance, while admitting that he or she likes the hipster look, hence shares the hipster taste.)

The reason why López de Sa’s explanation does not apply squarely onto the present case study is that the disagreement over hipsters is much more complex than, say, a disagreement over parsley. It is not, or at least, not exclusively, about taste. (Though taste, in a broad sense, is involved, such as music taste and fashion taste.) Some of the disagreement is aesthetic (as stressed e.g. in (9): “I don’t hate hipsters as people, I hate the hipster aesthetic”), but a lot of the disagreement turns on issues that arguably belong to the moral realm. This is not surprising, given that the underlying normative question is whether a group of people deserves to be hated, which calls for ethics-related justifications. Hating somebody just because of the way they look is perceived, in our society, as wrong, hence, even if de facto some of the hipster-haters hate them because of the way they look, they will likely try to back up their claims with arguments having to do with some moral qualities that they ascribe to hipsters. And this is indeed what we see in many posts, where hipsters are described as insincere (9), pretentious (10), hypocritical (15), pompous (15), arrogant (15, 21), snobbish/snobby (15, 21), or elitist (21), all of which thick terms that are used to convey negative value-judgements. Consumerism is another characteristic that various speakers appeal to (e.g. (11), (19), (23)) in order to justify their dislike for hipsters. Conversely, we can also pinpoint terms with positive valence in pro-hipster posts: really nice, well educated, friendly (8), intelligent, artsy, politically active, individualistic (20).

Turning back to the idea of a presupposition of commonality, we can see it at work in our case study in the following way. Although it is agreed from the start that the pro-hipsters and the anti-hipsters need not share their tastes, both sides presuppose that they share some more general values. For instance, they mutually take it for granted that the qualities of arrogance and insincerity are bad qualities – and then,

---

11 In a longer version of the article, I would have devoted a section to the relationship between thick terms and disagreement. In Cepollaro and Stojanovic (2016), we propose a presuppositional account of both thick terms and slurs. We analyze them as having a certain descriptive content while at the same time triggering an evaluative presupposition. For example, “arrogant” would refer to people who behave in a certain way, and at the same time trigger the presupposition that people who behave in that way are bad because of that. We also discuss what happens when the interlocutor does not endorse the evaluative presupposition (as in the case of so-called objectionable thick terms; see e.g. Väyrynen (2009)).

12 It is at least controversial whether ‘artsy’, ‘politically active’, or ‘individualistic’ should be considered as thick terms, and my own view would be that there are not, to the extent that no positive (or, for that matter, negative) valence is associated with those terms as a matter of their meaning. But in the present context, they are clearly used by the speaker of (20) in order to convey a positive value-judgement.
some anti-hipsters claim that these are, in general, qualities possessed by hipsters, while pro-hipsters balk at this kind of generalization. As a general pattern, the two sides in a dispute often agree on some more basic set of values – or, more precisely, they presuppose that they share some more basic set of values –, which in turn makes it possible for them to rationally disagree over partially normative issues, such as whether hipsters are dislikeable.

Just as this case study illustrates some presuppositions of commonality that are in place, it also serves to illustrate what happens when such a presupposition breaks down. Thus a couple of anti-hipster posts, e.g. (9), (11), or (19), aim to back up their dislike of hipsters by describing them as fashion-followers who care about trends, and, importantly, by assuming that to have this sort of property is bad, and that its badness must be mutually acknowledged. In (12) and (22), however, the speakers explicitly address – and reject – the presupposition that dressing like a hipster and caring about fashion is in any way bad. The clash between the two sides in this case is, then, one in which the relevant presupposition of commonality no longer holds: one side values interest in fashion negatively, while the other side does not value it negatively. There still is a disagreement, but one which is now about the sets of values that the two parties in the disagreement respectively endorse.

To take stock, we see several disagreement patterns:

(i) a metalinguistic disagreement over who counts as a “hipster”: people who are nice, well-educated, art-lovers etc. vs. people who have distorted the original idea and have turned it into an elitist and consumerist fashion trend;

(ii) a factual disagreement over the properties that are attributed to a group: whether hipsters are, generally speaking, arrogant, pretentious and insincere or, to the contrary, really nice and friendly; in this case, the two sides converge in valuing arrogance, pretentiousness and insincerity negatively, and niceness and friendliness positively;

(iii) a disagreement in values: the two parties may agree on a property that they attribute to hipsters as a group, such as that they like to dress in a certain fashion, yet they disagree whether having this property has any bad implications or not.

By way of wrapping up this case study, let me note that here, we did not see any support for either the metasemantic or the underdetermination approach. This should come as no surprise, because those two specifically aim at explaining why predicates of personal taste create dialogues that trigger intuitions of faultless disagreement.13

13 This being said, there is one respect in which the underdetermination proposal may be relevant. For even in this case study, we can notice a contrast between expressing a purely first-personal attitude (like or dislike) towards hipsters vs. arguing that people in general ought to have a certain attitude (like or dislike) towards them. The contrast is illustrated, for example, by the emphasized use of the first person pronoun in (18): “That's why I hate hipsters” as opposed to the generic construction “That's why it's something to be scorned” in (23). See also Stojanovic (2012a) for a related point concerning expressions of emotion.
2.2. Disagreements on taste vs. aesthetic and moral disagreements

I would like to close the paper with the same issue with which I got involved in the topic of disagreement, namely, with the idea that claims involving predicates of personal taste are semantically underdeterminate and, in particular, allow for readings in which the relevant value for the experiencer argument is specific (for example, the speaker, or some contextually relevant group) as well as readings on which this argument is bound by a covert generic operator. I would like to back up this claim by discussing some linguistic evidence that arguably demonstrates the presence of an experiencer argument. This is not necessarily specific to predicates of personal taste: for instance, adjectives 'difficult' and 'easy' and their ilk also come with an experiencer argument, and so do many adjectives that are derived from verbs, such as 'exhausting' or 'soothing'. Of course, one could say that these, too, belong among predicates of personal taste. I would prefer, though, to say that experiencing or, if you wish, perceiving difficulty, exhaustion, or the feeling sootheness, does not involve "taste." Nothing important hinges on this, though. More important to our present concerns is the idea that predicates of taste are, in this respect, different from aesthetic and, even more so, from moral predicates.

Although it remains somewhat controversial, in the linguistic literature, whether predicates of personal taste have an experiencer argument, the discussion over the past ten years or so points in the direction of an affirmative answer. There are two main tests have been proposed to detect the presence or absence of an experiencer. The first is to test whether the adjective may be used felicitously with a 'to' or 'for' phrase. Adjectives derived from verbs that denote events involving experiencers, as in the case of 'exhausting' and 'soothing', but also deverbal adjectives that do belong among predicates of personal taste, such as 'entertaining', 'boring', or 'disgusting', clearly pass this test. On the other hand, adjectives that are not derived from verbs do not always yield a clear and neat pattern. Thus, to take the two most discussed ones, 'tasty' and 'delicious', it is perfectly felicitous to say that the dish was tasty to Kathy, but it already sounds slightly worse to say that it was delicious to Kathy. Furthermore, we must be careful because both 'to' and 'for' constructions may be used as appositives with a reading equivalent to “in the opinion of”; an instance of this use was noted in example (23). And while the latter uses are relatively easy to distinguish at the level of syntax, yet a third complication comes from the fact that 'to' and 'for' can be used to introduce not an experiencer argument, but a beneficiary argument, as in:

25. She is kind to me.
26. Circulating information in advance will be helpful for most students.

14 In the growing literature on predicates of personal taste, there is no consensus regarding the presence of an experiencer argument. For instance, Lasersohn (2005) and Sundell (2015) do not think that experiencers are represented in the syntactico-semantic structure, while Glanzberg (2007), Stojanovic (2007), Stephenson (2007), Sæbø (2009), Bylinina (2014, 2015) and McNally and Stojanovic (2016) argue that experiencers (at least for certain predicates) must be taken into account at some level of the analysis.

Isidora Stojanovic, “Expressing Disagreement”
Another test that has been proposed to identify adjectives with experiencers is whether they may be used felicitously with the verb 'find' (Sæbø 2009, Bylinina 2014, Umbach 2015), as in:

27. Many people find chimichurri delicious.

However, this test may be treacherous, because adjectives that arguably do not come with an experiencer argument can, in a suitable context, felicitously co-occur with 'find'. Thus in a context in which there is no prior agreement on how tall a person must be to count as “tall”, the following is perfectly acceptable:

28. I find that person tall.

In McNally and Stojanovic (2016), we argue that for a sentence such as (28) to be felicitous, the attribution of tallness must be made on the basis of the speaker’s prior experience with different individuals’ heights. Thus, notwithstanding appearance, the 'find'-construction introduces an experiencer argument, even if the argument is not lexically associated with the adjective embedded under 'find'.

Granted that we have good reasons to think that predicates of personal taste come with an experiencer argument, this does not yet show that, when the predicate occurs alone, that is, when it is not accompanied by constructions involving 'to', 'for', or 'find', there may in principle be different readings available, depending on the context. One alternative would be to say that for any such use, the generic reading is mandatory; I take it that proposals in this spirit have been given e.g. in Moltmann (2010) and Pearson (2013). In order to adjudicate between the two sorts of accounts, what we would need are robust empirical data, which I am not aware that have been gathered yet. For the time being, I must stay content with offering some intuitive support. Compare the following two:

29. That meal was delicious!
30. Parsley is delicious.

The statement in (30) is about parsley in general, which consolidates the generic interpretation of the implicit experiencer argument – we thus easily understand (30) as stating that parsley is delicious to people in general. By contrast, the statement in (29) is about a particular event, a certain meal, which invites us to interpret (29) as stating that the meal (qua food served at the meal qua event) was delicious presumably to the

15 It is interesting to consider examples of ‘find’ when it embeds a predicates that normally does not come with an experiencer argument, but comes with an implicit beneficiary argument, as e.g. “I find this helpful”. I would suggest that the use of ‘find’ forces the introduction of an experiencer argument, whose value is the speaker (qua the subject of ’find’), while the beneficiary argument could, depending on the context, get the same value as the experiencer argument, but it could also be generically bound.

16 In other words, we would need to run experiments testing for the availability of the different readings.
people who were having the meal.  

I would like to suggest that in (29), although the reference to a specific meal constrains the interpretation of the experiencer argument associated with 'delicious', there may still be more than one reading available. Suppose that Kathy utters (29). We may understand her as saying that the meal was delicious to her, but we may equally well understand her as saying that it was delicious to other people who were having that meal. Which interpretation is “the right one” is a question that need not be settled in case of a normal dialogue. The issue might only arise if something goes wrong in the conversation that happens to hinge upon that issue. This is true, in particular, if a disagreement arises. Suppose that Kathy is talking to Rob, who had the same meal but did not find it delicious. Again, pretty much as in the case of (1), the different ways in which the dialogue may evolve make it possible to demarcate the different readings, allowing the speaker to make her statement more explicit. Here are two options:

31. Kathy: “That meal was delicious!”
   Rob: “Delicious?!?! Are you joking?”
   Kathy: “Well, the dish that I had was really delicious.”
   Rob: “Well, lucky you. My dish tasted horrible.”

32. Kathy: “That meal was delicious!”
   Kathy: “Oh? Sorry to hear that. Well, then, it wasn’t delicious.”

The ways in which the two dialogues evolve suggests that in (31), the intended interpretation for the experiencer argument was Kathy herself, whereas in (32), it was both Kathy and Rob. In English and, for that matter, in Romance and Slavic languages, there are no specific linguistic clues to disambiguate between the two readings. But consider a language like Japanese, which possesses sentential markers akin to evidentials. There are several ways of saying (29) in Japanese:

Isidora Stojanovic, “Expressing Disagreement”

17 Bylinina (2014), (2015) provides a very attractive analysis of predicates of personal taste, according to which they are predicates that make reference to an experience event as part of their semantics. Her analysis fits the spirit of the proposal that I am defending. In a later draft revision, I might try to restate these ideas in terms of a semantics that takes reference to events as basic, and reference to agents or experiencers as derivative.

18 As the data in Kneer (2015), ordinary people do not find it all that natural to retract claims over matters of taste. But consider a scenario in which Kathy and Rob have been given an evaluation sheet to rate their meal, say, from one to five stars. Though Kathy may have been initially leaning towards 5 stars, after Rob's testimony, she would likely go down to 2 or 3 stars, which is evidence that she would no longer state that the meal – that is, their joint meal – was delicious.

19 If we adopted an event-style framework, as in Bylinina (2014) (see the previous footnote), the ambiguity would presumably correspond to the ambiguity between referring to a larger event of Kathy and Rob's joint meal in (32), vs. referring to the subevent of the Kathy's own meal in (31).

20 Note that in Japanese, the grammatical subject is not mandatory and is preferably not articulated, so that, accordingly, none of the three contains any expression referring to the meal.
33. Oishikatta desu!
34. Oishikatta desu-ne!
35. Oishikatta desu-yo!

The difference between (34) and (35) is that the particle '-ne' is used with the sense of eliciting approval from the interlocutor (a bit like “That meal was delicious, wasn't it?”), whereas the particle '-yo' emphasizes that the speaker is reporting an experience of their own, which was not shared by the interlocutor. (33) is neutral, but then, it is not a sentence that a Japanese would naturally use. The choice between (34) and (35) constrains, then, the possible interpretations for the experiencer argument, so that either it includes the interlocutor (as with '-ne') or it doesn't (as with '-yo').

This completes the part of the argument that aims to demonstrate, first, that predicates of taste come with an experiencer argument, and, second, that when the argument is left implicit, there may be, in principle, different readings available. What I would now like to do is point out that neither genuine aesthetic predicates nor moral predicates normally come with an experiencer argument. For reasons of space, I will not go at length into discussing aesthetic and moral predicates, nor will I try to give any criteria that make it possible to demarcate an aesthetic predicate from a predicate of personal taste, or to distinguish a moral predicate from an ordinary predicate. I will simply make some observations (drawing on McNally and Stojanovic (2016)) to the effect that these predicates do not come with experiencers. (I take it that this should not require much convincing, as most people don't initially think that they do come with experiencers.)

The first piece of evidence is that moral and aesthetic predicates do not pattern well with 'to' and 'for' adjuncts. Consider:

36. Female circumcision is wrong to many doctors.
37. Louise Labé's poetry is balanced to most scholars.

If there is a sense in which (36) and (37) may sound acceptable, that is because we hear “to many doctors” and “to most scholars” as a prejacent, in the sense of “according to many doctors/most scholars”. Note that replacing 'to' with 'for' makes little difference.

The second piece of evidence is that such predicates are also underfelicitous with the 'find' construction. Compare:

38. Many doctors find/consider female circumcision wrong.

If (38) is to be understood as a claim reporting doctors' moral judgment towards female circumcision, then 'consider' is much better than 'find'. Similarly, if (39) is to be understood as a claim reporting scholars' aesthetic judgment regarding Labé's poetry, then, again, 'consider' is much better than 'find'. This being said, the 'find' alternative may still sound acceptable. I submit that the use of 'find' in such cases...
conveys that the doctors have arrived at their moral judgment based on their experience (as, for instance, their medical experience that allows them to be aware of the suffering induced by circumcision), and that the scholars have similarly formed their aesthetic judgment based on experience (as, for instance, by perceiving a certain acoustic balance in the metrics of Labé’s poems).

The upshot of these semantic differences between predicates that involve an experiencer and those that do not is that the former, when they occur in language, are more likely to allow for various different interpretations (not to say disambiguations) than the latter. As a consequence, we should expect the patterns of disagreement over claims involving the former vs. the latter to be different from each other. In particular, the underdetermination approach will not be immediately applicable to aesthetic and moral disagreement. I take that to be good news, given that, as a matter of fact, they are different phenomena. After all, we all know the proverb *De gustibus non (est) disputandum*, but we know no proverb that says *De artibus or De moralibus non (est) disputandum*.

Acknowledgments

I would like to thank in advance the conference organizers, as well as Ethan Jerzak. My institute's participation in grants ANR-10-LABX-0087 IEC and ANR-10-IDEX-0001-02 PSL also needs to be acknowledged.
